3.2 Create, Select, and Drop a Database

This section will guide you to:

- Set up Eclipse to work with JDBC
- Create an HTML page to call a servlet
- Create a servlet that will use JDBC to create, use, and drop a database

Development Environment

- Eclipse IDE for Enterprise Java Developers v2019-03 (4.11.0)
- Apache Tomcat Server v9.0
- JRE: OpenJDK Runtime Environment 11.0.2
- MySQL Connector for Java 8.0.16

This guide has twelve subsections, namely:

3.2.1   Creating a dynamic web project

3.2.2   Adding the jar files for MySQL connection for Java

3.2.3   Creating an HTML page index.html

3.2.4   Creating a DBConnection class to initiate a JDBC connection in code

3.2.5   Creating a config.properties file to store JDBC credentials

3.2.6   Creating a DBOperations servlet

3.2.7   Configuring web.xml

3.2.8   Checking for servlet-api.jar

3.2.9   Building the project

3.2.10   Publishing and starting the project

3.2.11   Running the project

3.2.12   Pushing the code to your GitHub repositories

Step 3.2.1: Creating a dynamic web project

- Open Eclipse
- Go to the **File** menu. Choose **New->Dynamic Web Project**
- Enter the project name as **JDBCSetup**. Click on **Next**
- Enter nothing in the next screen and click on **Next**
- Check the checkbox **Generate web.xml deployment descriptor** and click on **Finish**
- This will create the project files in the Project Explorer

Step 3.2.2: Adding the jar files for MySQL connection for Java

- **mysql-connector-java.jar** is already present in your lab. To learn about its directory path details you can refer the **lab guide for phase 1**
- Take **mysql-connector-java.jar** file from the folder mentioned in the lab guide for phase 1 and add it to the project's **WebContent/WEB-INF/lib** folder

Step 3.2.3: Creating an HTML page index.html

- In the Project Explorer, expand the project **JDBCSetup**
- Expand **WebContent**. Right click on **WebContent**. Choose **New->HTML File**
- Enter the filename as index.html and click on **Finish**
- Enter the following code:

```html
<!DOCTYPE html>
<html>
<head>
<meta charset="UTF-8">
<title>JDBC Datbase Operations</title>
</head>
<body>
<a href="dboperations">Database Operations</a><br>

</body>
</html>
```

- Click on the **Save** icon

Step 3.2.4: Creating a DBConnection class to initiate a JDBC connection in code

- In the Project Explorer, expand **JDBCSetup->Java Resources**
- Right click on **src** and choose **New->Class**
- In **Package,** enter **com.ecommerce** and in **Name** enter **DBConnection** and click on **Finish**

- Enter the following code:

```java
package com.ecommerce;

import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

public class DBConnection {

    private Connection connection;

    public DBConnection(String dbURL, String user, String pwd) throws ClassNotFoundException,
SQLException{

        Class.forName("com.mysql.jdbc.Driver");
        this.connection = DriverManager.getConnection(dbURL, user, pwd);
    }

    public Connection getConnection(){
        return this.connection;
    }

    public void closeConnection() throws SQLException {
        if (this.connection != null)
            this.connection.close();
    }
}
```

Step 3.2.5: Creating a config.properties file to store JDBC credentials

- In the Project Explorer, expand the project **JDBCSetup**

- Expand **WebContent**. Right click on **WebContent**. Choose **New->File**

- Enter the filename as config.properties and click on **Finish**

- Enter the following data:

```
url=jdbc:mysql://localhost:3306/ecommerce
userid=root
password=master
```

Step 3.2.6: Creating a DBOperations servlet

- In the Project Explorer, expand **JDBCSetup->Java Resources**

- Right click on **src** and choose **New->Servlet**

- In **Class Name,** enter **DBOperations** and click on **Finish**

- Enter the following code:

```java
import java.io.IOException;
import java.io.InputStream;
import java.io.PrintWriter;
import java.math.BigDecimal;
import java.sql.CallableStatement;
import java.sql.ResultSet;
import java.sql.SQLException;
import java.sql.Statement;
import java.util.Properties;

import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

import com.ecommerce.DBConnection;

/**
* Servlet implementation class DBOperations
*/
@WebServlet("/DBOperations")
public class DBOperations extends HttpServlet {
    private static final long serialVersionUID = 1L;

    /**
* @see HttpServlet#HttpServlet()
*/
    public DBOperations() {
        super();
        // TODO Auto-generated constructor stub
    }

    /**
     * @see HttpServlet#doGet(HttpServletRequest request, HttpServletResponse response)
     */
    protected void doGet(HttpServletRequest request, HttpServletResponse response) throws
ServletException, IOException {
        // TODO Auto-generated method stub

        try {
            PrintWriter out = response.getWriter();
            out.println("<html><body>");

            InputStream in = getServletContext().getResourceAsStream("/WEB-INF/config.properties");
            Properties props = new Properties();
            props.load(in);

            DBConnection conn = new DBConnection(props.getProperty("url"), props.getProperty("userid"),
props.getProperty("password"));
            Statement stmt = conn.getConnection().createStatement();
            stmt.executeUpdate("create database mydatabase");
```

```java
            out.println("Created database: mydatabase<br>");
            stmt.executeUpdate("use mydatabase");
            out.println("Selected database: mydatabase<br>");
            stmt.executeUpdate("drop database mydatabase");
            stmt.close();
            out.println("Dropped database: mydatabase<br>");

            conn.closeConnection();

            out.println("</body></html>");
            conn.closeConnection();

        } catch (ClassNotFoundException e) {
            e.printStackTrace();
        } catch (SQLException e) {
            e.printStackTrace();
        }

    }

    /**
     * @see HttpServlet#doPost(HttpServletRequest request, HttpServletResponse response)
     */
    protected void doPost(HttpServletRequest request, HttpServletResponse response) throws
ServletException, IOException {
        // TODO Auto-generated method stub
        doGet(request, response);
    }

}
```

Step 3.2.7: Configuring web.xml

- In the Project Explorer, expand **JDBCSetup->WebContent->WEB-INF**

- Double click on **web.xml** to open it in the editor

- Enter the following script:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<web-app xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns="http://xmlns.jcp.org/xml/ns/javaee" xsi:schemaLocation="http://xmlns.jcp.org/xml/ns/javaee
http://xmlns.jcp.org/xml/ns/javaee/web-app_4_0.xsd" id="WebApp_ID" version="4.0">
  <display-name>JDBC DB Operations</display-name>
  <welcome-file-list>
    <welcome-file>index.html</welcome-file>
    <welcome-file>index.htm</welcome-file>
    <welcome-file>index.jsp</welcome-file>
```

```
  <welcome-file>default.html</welcome-file>
  <welcome-file>default.htm</welcome-file>
  <welcome-file>default.jsp</welcome-file>
 </welcome-file-list>
 <servlet>
  <servlet-name>DBOperations</servlet-name>
  <servlet-class>DBOperations</servlet-class>
 </servlet>
 <servlet-mapping>
  <servlet-name>DBOperations</servlet-name>
  <url-pattern>/dboperations</url-pattern>
 </servlet-mapping>

</web-app>
```

Step 3.2.8: Checking for servlet-api.jar

- Before building the project, we need to confirm that **servlet-api.jar** has been added to the project

- In the Project Explorer, right click on **JDBCSetup** and choose **Properties**

- Select **Java Build Path** from the options on the left

- Click on **Libraries** tab on the right

- Under **ClassPath,** expand the node that says **Apache Tomcat**

- If there is an existing entry for **servlet-api.jar,** then click on **Cancel** and exit the window

- If it is not there, then click on **Classpath** entry and click on **Add External JARs** button on the right

- From the **file** list, select **servlet-api.jar** file and click on **Ok**

- Click on **Apply and Close**

Step 3.2.9: Building the project

- From the **Project** menu at the top, click on **Build**

- If any compile errors are shown, fix them as required

Step 3.2.10: Publishing and starting the project

- If you do not see the **Servers** tab near the bottom of the IDE, go to the **Window** menu and click on **Show View->Servers**

- Right click the **Server** entry and choose **Add and Remove**

- Click the **Add** button to move **JDBCSetup** from the **Available** list to the **Configured** list

- Click on **Finish**

- Right click on the **Server** entry and click on **Publish**

- Right click on the **Server** entry and click on **Start**

- This will start the server

Step 3.2.11: Running the project

- To run the project, open a web browser and type: **http://localhost:8080/JDBCSetup**

Step 3.2.12: Pushing the code to your GitHub repositories

Open your command prompt and navigate to the folder where you have created your files

```
cd <folder path>
```

Initialize your repository using the following command:

```
git init
```

Add all the files to your git repository using the following command:

```
git add .
```

Commit the changes using the following command:

```
git commit . -m "Changes have been committed."
```

Push the files to the folder you initially created using the following command:

```
git push -u origin master
```
